FROM: Joseph Meek III PE, PTOE, Transportation Analyst Transportation Planning Analysis Unit

SUBJECT: UPDATED: Rogue River Technical Memorandum \#5 Future 2040 No-

This memo analyzes Rogue River's 2040 future-no-build conditions. This memorandum is updated from the March 2018 version with revised volume-capacity and level of service values. This will provide an overview of future transportation system operations and deficiencies. This analysis includes an evaluation of the study intersections. Analysis results will identify future transportation system needs for motorized and nonmotorized travel modes.

In the 2040 future conditions analysis, there were intersections exceeding volume-tocapacity (V/C) targets or standards, especially the 55 interchange and downtown area. There will be substantial queuing impacts and safety related issues on the I5 off-ramps and Depot Street starting at OR99 going through the interchange area and up to the Pine \& Main Street intersection. Heavier traffic conditions will make walking and bicycling less comfortable and transit potentially less reliable.

## Background

The City of Rogue River is in Jackson County along I5 and OR99 and is part of the Middle Rogue Metropolitan Planning Organization (MRMPO). In July 2011, Rogue River's population was 2,140 . This is projected to grow $40 \%$ to 3,975 by 2040 by Portland State University's Center for Population Research, stated in Technical Memorandum \#3. The city has expanded south beyond manmade and natural barriers of railroad tracks, an interstate, and a river. The I5/Depot Street interchange is crammed in between the Central Oregon and Pacific railroad tracks and the Rogue River which becomes a series of restrictive barriers in close proximity to each other. To add to this
of the river. Pine/Classick Dr is even closer and a difficult barrier to cross. This leads to safety risks, traffic operations issues, and problems in future planning.

The City has developed from south of the Rogue River and stretched north beyond the city limits to build the high school on East Evans Creek Road (Pine Street in Rogue River). The main street of the community is the east/west oriented E Main Street/W Main Street/Foothill Boulevard. This is connected to I5 and OR99 by way of Depot Street.

## Evaluation Criteria and Analysis

Intersection operations analysis results were compared to ODOT and the county standards and targets to assess performance and potential improvement. The City appears not to have traffic operational standards, so a v/c ratio of 0.95 was used, equivalent to both a state district-level highway v/c target in the Oregon Highway Plan (OHP) and Jackson County's inside-MPO standard. Jackson County and ODOT use volume to capacity (V/C) ratios, which compare traffic volume entering an intersection to theoretical capacity of an intersection. A v/c ratio of 1.0 indicates an intersection operating at capacity, while a v/c ratio over 1.0 indicates an intersection's capacity is exceeded.

The 1999 OHP mobility standards (amended in 2015) were used to evaluate v/c ratios for state highways in an MPO. Under the OHP, the maximum acceptable V/C ratio for I5 and the interchange ramp terminals is 0.85 and 0.95 for OR99. Jackson County uses V/C standard of 0.95 for intersections within an MPO.

The intersection operations analysis was conducted using SIDRA Version 7 software, with Highway Capacity Manual (HCM) 2010 methodologies. Signalized intersection V/C's were calculated using the critical volume to capacity ratio process described in HCM 2010. The I5 mainline segments and merge/diverge areas were analyzed with HCS 2010. Queuing was developed using the SIDRA software.

## Volume Development

The 2040 volumes were grown from the $201630^{\text {th }}$ highest hour volumes developed in Technical Memorandum \#4. This aggregates the 2016 existing year conditions with the through trip growth and separate estimates of residential, commercial and industrial growth to compute the 2040 future volumes. See Appendix A for calculations and volume components for developing 2040 volumes.

The background through trip growth is based on historical Jackson County counts and ODOT's Future Volume Tables. These were taken approximately where the study area roadways cross the Urban Growth Boundary (UGB).

The residential, industrial, and commercial growths were based on differences between the 2040 and 2016 values in Technical Memorandum \#3. New single family homes, manufactured homes, and apartments were placed following City zoning and direction.

Residential volumes were calculated using Institute of Traffic Engineers (ITE) Trip Generation equations and then distributed to destinations.

In determining commercial and industrial growth, commuters traveling in and out of the city were split out from internal city commuters. ODOT's Statewide Integrated Model (SWIM) determined percentages of commuters traveling to Jackson County (Medford area), Josephine County (Grants Pass area) and local destinations, which determined:

- $32 \%$ of workers commuting via a vehicle go or from Jackson County
- $42 \%$ of workers commuting via a vehicle go or from Josephine County
- $26 \%$ commute locally

The commuter trips were further modified with American Community Survey (ACS) 2010-2015 commuting-to-work data for Rogue River:

- $13 \%$ walked/other
- $9 \%$ worked from home
- $8 \%$ carpooled

Commuting commercial and industrial employees going outside Rogue River were reduced by the carpool percentage. Local commercial employees were reduced by the walk/other and working from home percentages, while industrial employees were only reduced by the walk/other percentage.

SWIM determined commercial employee trip generation. The ITE Trip Generation "General Light Industrial" equation converted industrial employees to trips. A combination of typical land use types (i.e. gas station, motel, specialty retail, etc.) determined the inbound/outbound percentages.

SWIM also determined distribution of trips using the 2034 future scenario. The surrounding area was split into districts indicated below. "Outside" zones are trips to anywhere else, such as to Douglas County or California. The resulting distributions were generally consistent with the ACS, commuter patterns, and local perceptions. The general trip distribution was:

- From/to rest of Jackson County (via I5 and OR99) : 28\%
- From/to Josephine County (via I5 and OR99): 47\%
- From/to zones south of OR99 ( via OR99 in both directions) : 20\%
- From/to Outside zones (via I5, both directions) : 5\%

The resulting individual residential, commercial, industrial, and total 2040 volumes are shown in Appendix A.

## 2040 Existing Conditions Analysis Results

## Preliminary Signal Warrants

Preliminary Signal Warrants (PSW) were evaluated to determine if study area intersections were eligible for potential traffic control changes including signalization.

ODOT's Preliminary Signal Warrants (PSW) are based on Manual of Uniform Traffic Control Devices (MUTCD) Warrant 1 (Case A and B). Case A and B deal primarily with high volumes on the minor street and high volumes on the major street, respectively. Meeting preliminary signal warrants does not guarantee that a signal (or other change) will be installed. An intersection traffic control study would be needed by the appropriate jurisdiction weighing costs and benefits of such a change. For example, traffic signals can degrade a previously non-stopped major roadway while enhancing minor street operation. A traffic signal may introduce safety hazards that outweigh the benefits. In ODOT's jurisdiction, traffic signal warrants must be met and the State Traffic Engineer's approval obtained before a traffic signal is installed. No intersections met PSW's for 2040; however Main \& Pine Street and Pine \& Depot Street are close.

## Volume to Capacity ratio \& Level of Service

For 2040, future volumes were evaluated to describe operating conditions. Table 1 shows v/c ratios for project area intersections; some are beyond the maximum allowable V/C ratio ( 0.85 or 0.95 for OHP) or 0.95 for county jurisdiction. For additional information on operation, delay-based LOS is shown.

Table 1: 2040 V/C Ratios \& LOS

| Intersection | LOS $^{1}$ | Highest Movement ${ }^{2}$ | $\begin{gathered} \text { V/C } \\ \text { Ratio }^{3} \end{gathered}$ | Queue ${ }^{4}$ <br> (ft) | Agency | Standard |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Depot St at Pine St | F (east) | EB | 0.72 | max | City | 0.95 |
| Depot St and I5 NB | E | SB | 1.07 | max | ODOT | 0.85 |
| Depot St and I5 SB | F | NB | 1.07 | max | ODOT | 0.85 |
| Depot St and OR99 | E | EB | 0.63 | 275 | ODOT | 0.85 |
| Depot St and Main St | $\begin{gathered} \text { C } \\ \text { (south) } \end{gathered}$ | NB | 0.36 | 50 | City | 0.95 |
| Main St and Wards Creek Rd | $\begin{gathered} \mathrm{B} \\ \text { (north) } \end{gathered}$ | SB | 0.13 | < 50 | City | 0.95 |
| Main St and Cedar St | $\begin{gathered} \mathrm{C} \\ \text { (north) } \end{gathered}$ | SB | 0.29 | < 50 | City | 0.95 |
| Main St and Broadway St | $\begin{gathered} \mathrm{C} \\ \text { (north) } \end{gathered}$ | SB | 0.35 | < 50 | City | 0.95 |
| Foothill Blvd and W Evans Creek Rd | $\begin{gathered} \mathrm{B} \\ \text { (north) } \end{gathered}$ | SB | 0.28 | < 50 | City | 0.95 |
| Main St and Pine St | E | WB | 1.08 | 325 | City | 0.95 |
| N River Rd and Classick Dr | B (east) | EB | 0.13 | < 50 | City | 0.95 |

${ }^{1}$ Corresponding leg that applies to the LOS is shown.
${ }^{2}$ The Highest Movement describes queues
${ }^{3}$ Black cells are V/Cs at or exceeding standard
${ }^{4}$ Black cells are queues that block other intersections
The ramp terminal intersections are over capacity at 1.07.
Table 2 shows the v/c for mainline I5 and the merge and diverge areas of the ramps. Under normal operation I5 should perform quite well, as seen in Table 2; no locations were over the 0.85 maximum OHP v/c target. Analysis worksheets are in Appendix B.

Table 2: 2040 Mainline \& Merge/Diverge v/c for I5 at Rogue River Interchange

| Section | V/C |
| :--- | :---: |
| NB north of interchange | 0.28 |
| SB north of interchange | 0.28 |
| NB Diverge from I5 | 0.62 |
| SB Diverge from I5 | 0.61 |
| NB between ramps | 0.23 |
| SB between ramps | 0.23 |
| NB Merge onto I5 | 0.67 |
| SB Merge onto I5 | 0.65 |
| NB south of interchange | 0.28 |
| SB south of interchange | 0.28 |

## Average Daily Traffic to Capacity Ratio

With high volume to capacity ratios on Depot and Pine Streets and potential extensive queuing, peak spreading was investigated. This is when more traffic is on the roadway network than can be handled in a single peak hour and traffic spreads into adjacent hours. Adjacent peak hours will still be busy. Any spreading to occur in Rogue River would spread later beyond the 3:30-4:30 PM system peak hour as the school release time limits this from moving earlier in the day. The ADT/C ratio measures the potential of peak spreading and impact of congestion. The ADT/C is the ratio of daily traffic to capacity (capacity is defined by intersection approach). The highest approach ADT/C is reported for each intersection, except for Depot and Pine Street as the Classick Drive ADT/C was excessively high due to a very low approach capacity.

Table 3: 2040 ADT/C Ratio:

| Intersection | Highest <br> ADT/C |
| :--- | :---: |
| Depot St at Pine St | 7.01 |
| Depot St and I5 NB | 11.06 |
| Depot St and I5 SB | 10.36 |
| Depot St and OR99 | 6.31 |
| Depot St and Main St | 10.76 |
| Main St and Wards Creek Rd | 1.17 |
| Main St and Cedar St | 2.94 |
| Main St and Broadway St | 5.80 |
| Foothill Blvd and W Evans Creek Rd | 3.43 |
| Main St and Pine St | 12.94 |
| N River Rd and Classick Dr | 1.30 |

The ADT/C methodology was developed for FHWA (i) and has been used by ODOT for the statewide congestion management system. It is a higher level of congestion rating compared to queueing. ADT/C thresholds are as shown in Table 4.

ADT/C ratios of $6.75-10.75$ are more of the standard peak " 15 -min" typical urban congestion that stays within a single hour. Peak spreading is more likely to occur once the

ADT/C exceeds 10.75 when speeds decrease for good portions of the peak hour. Peak spreading is occurring with ADT/C's of 15.25 or greater.

Table 4: ADT/C Congestion Level Thresholds

| Level | Condition | Description | Lower <br> ADT/C | Upper <br> ADT/C |
| :---: | :--- | :--- | :---: | :---: |
| 1 | Uncongested | No decrease in speeds during <br> the peak hour. | 0.00 | 6.75 |
| 2 | Uncongested to <br> Moderately |  | 6.75 | 8.25 |
| 3 | Moderately <br> Congested | Speeds decrease slightly <br> during portions of the peak <br> hour. | 8.25 | 9.25 |
| 4 | Moderately to <br> Congested |  | 9.25 | 9.75 |
| 5 | Congested <br> 6 | Congested to <br> Very | Speeds decrease significantly <br> during portions of the peak <br> hour. | 9.75 |
| 7 | Very Congested | Speeds decrease substantially <br> for substantial portions of the <br> peak hour. | 12.25 | 13.75 |
| 8 | Very to <br> Extremely | 10.75 | 12.25 |  |
| 9 | Extremely <br> Congested | Speeds decrease substantially <br> for more than the peak hour. | 15.25 | 24.00 |

Peak spreading was investigated and while peak hours will be heavy through the entire hour, trips will likely not delay to another hour. Main \& Pine Street’s high potential for extended congestion, reflected in queuing and ADT/C, merits investigation for improvements.

## 95 ${ }^{\underline{t h}}$ Percentile Queues

In addition to V/C ratios, $\mathrm{ADT} / \mathrm{C}$ ratios, and LOS, the $95^{\text {th }}$ percentile queues were analyzed to better understand system operation. Excessively long queues are often seen in areas where V/C ratios exceed standards. Figure 1 shows $204095^{\text {th }}$ percentile queuing of the study area. The largest queuing concerns are:

Depot Street and Pine Street: eastbound queue extends to intersection of Main Street and Pine Street. Therefore, the southbound queue waiting for a gap in traffic may extend more than shown, affecting Depot Street.

Depot St and I5 NB: southbound and northbound queues extend to the Pine Street intersection as well as the southbound ramp. The 300 foot queue is a concern as it potentially extends into the ramp deceleration portion.

Figure 1: 95 ${ }^{\text {th }}$ Percentile Queues

Depot St and I5 SB: southbound and northbound queues extend under I5 from intersection ramp to intersection ramp (both directions). This also means there is a queue that spills back to OR99. The 400 foot queue up the ramp is a significant concern as it may extend into the ramp deceleration portion.

Depot St and Main St: with only a minor delay at one intersection, there will be continuous standing traffic from OR99 to Main Street (entire length of Depot Street). The queue from Pine Street and Main Street will affect operation of this intersection.

The constrained interchange section can cause a number of operational issues. Any kind of incident or delay (parking operation or large truck turning) on Depot Street or a train crossing can quickly create congestion up the ramps and onto I5 mainline. Extending queues into the ramp deceleration portion or mainline traffic is a safety issue. Drivers may have to prematurely brake or brake harder than expected. This would increase the potential of rear-end crashes. The southbound off-ramp is more likely to have this problem more often than the northbound direction.

Southbound ramp terminal geometry is tight enough that trucks turning left can interfere with vehicles waiting in the left turn lane to head south on I5. The ramp is between I5 and the Rogue River Greenway and the Rogue River.

## Non-Motorized Operations

The pedestrians and bicyclists counted from 3:00 to 5:00 p.m. were updated with the $40 \%$ population growth rate (Technical Memorandum \#3) from 2016 to 2040, Tables 5 and 6. There is a base level of use on the pedestrian and bicycle system throughout the City even in the highest vehicular volume areas.

Table 5: Pedestrian Crossings

| Intersection | Pedestrian Crossings 3-5PM peak period |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | North | East | South | West |
| Depot St at Pine St | 0 | 4 | 0 | 3 |
| Depot St and I5 NB | 1 | 10 | 0 | 10 |
| Depot St and I5 SB | 3 | 6 | 4 | 8 |
| Depot St and OR99 | 0 | 1 | 3 | 3 |
| Depot Stand Main St | 11 | 7 | 8 | 48 |
| Main St and Wards Creek Rd | 4 | 0 | N/A | 3 |
| Main St and Cedar St | 36 | 17 | N/A | 3 |
| Main St and Broadway St | 14 | 4 | N/A | 14 |
| Foothill Blvd and <br> W Evans Creek Rd | 5 | 15 | N/A | 0 |
| Main St and Pine St | 14 | 13 | 39 | 20 |
| N River Rd and Classick Dr | 6 | N/A | 0 | 0 |

Bicycle, pedestrian, and transit are largely influenced by adjacent modes. Without any planned projects, there is no difference between the 2016 and 2040 conditions. As traffic congestion grows comfort of bicyclists and pedestrians will decrease. Congestion at the interchange and surrounding roadways may cause issues with transit schedule.

## Table 6: Bicycle Movements

| Intersection | Bicycles Entering Volumes 3-5PM peak period |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | North | East | South | West |
| Depot St at Pine St | 0 | 0 | 4 | 1 |
| Depot St and I5 NB | 1 | 0 | 4 | N/A |
| Depot St and I5 SB | 1 | N/A | 4 | 0 |
| Depot St and OR99 | 11 | 4 | 0 | 0 |
| Depot St and Main St | 0 | 0 | 1 | 1 |
| Main St and Wards Creek Rd | 1 | 0 | N/A | 1 |
| Main St and Cedar St | No Data | No Data | N/A | No Data |
| Main St and Broadway St | 0 | 1 | N/A | 3 |
| Foothill Blvd and <br> W Evans Creek Rd | 3 | 0 | N/A | 1 |
| Main St and Pine St | 0 | 0 | 0 | 1 |
| N River Rd and Classick Dr | 0 | N/A | 0 | 0 |

## Summary

There are intersections beyond the maximum allowable v/c ratios in 2040 specifically at the interchange and along Pine Street. None of these intersections meet PSWs. Queuing and congestion along Pine and Depot Streets are extensive. This may cause issues on I5 off-ramps as drivers may need to brake prematurely, increasing the potential of crashes. Increasing vehicular flows will mean decreased bicycle and pedestrian comfort as well as less reliable transit service.

| Intersection | 1143 | 2.0 |  | 0.631 |  | 14.4 | LOS B | 3.7 | 93.7 |  |  |  |  |

Site Level of Service (LOS) Method: Delay \& v/c (HCM 2010). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.
LOS F will result if $\mathrm{v} / \mathrm{c}>1$ irrespective of lane delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 2010).
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.
HV (\%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay \& v/c (HCM 2010). Site LOS Method is specified in the Network Data dialog (Network tab). Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.
HV (\%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
Largest change in Average Back of Queue or Degree of Saturation for any lane during the last three iterations: 21.1 \%
Number of Iterations: 10 (maximum specified: 10)

N1 Arrival Flow value is reduced due to capacity constraint at oversaturated upstream lanes.

| Movement Performance - Pedestrians |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { Mov } \\ & \hline \text { ID } \end{aligned}$ | Description | Demand Flow ped/h | Average Delay sec | Level of Service | Average Back Pedestrian ped | of Queue Distance ft | Prop. Queued | Effective Stop Rate per ped |

TIMING ANALYSIS
6 Site: 102 [DepotStNBi5]
Depot St at I5 NB entrance
Signals - Actuated Coordinated Cycle Time $=100$ seconds (Network Cycle Time - Program)
Common Control Group: CCG1 [CCGName]

Phase Times determined by the program
Phase Sequence: CCG Phasing
Reference Phase: Phase A
Input Phase Sequence: A, B
Output Phase Sequence: A, B

\# Combined timing results are shown for all Movement Classes except any listed separately.

* Critical Movement/Green Period
$\wedge$ Pedestrian Actuation / Phase Actuation for probability of no arrivals in an average signal cycle:
For Pedestrian / Vehicle Movements, the Minimum Required Time, Lost Time and Effective Green Time have been reduced.

Min/Max When the Required Movement Time is subject to minimum or maximum condition, the Flow Ratio and the corresponding Required Green Time Ratio are not used for cycle time calculations and the Adjusted Lost Time equals the Required Movement Time.

| Phase Information |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Phase | Ref. Phase | Change Time | Starting Intergreen | Green Start | Displayed Green | Green End | Terminating Intergreen | Phase Time | Phase Split |
|  |  | sec | sec | sec | sec | sec | sec | sec | \% |
| A | Yes | 0 | 4 | 4 | 50 | 54 | 4 | 54 | 54 |
| B | No | 54 | 4 | 58 | 42 | 100 | 4 | 46 | 46 |

This table gives adjusted values of Intergreen Time, Phase Time and Green Time values in cases of Pedestrian Actuation, Phase Actuation and Phase Frequency values (user-specified or implied) less than 100\%. See the Phase Information section in the Detailed Output report for input values of Yellow Time, All-Red Time and the unadjusted Intergreen Times.

Site Level of Service (LOS) Method: Delay \& v/c (HCM 2010). Site LOS Method is specified in the Network Data dialog (Network tab). Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (\%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
Largest change in Average Back of Queue or Degree of Saturation for any lane during the last three iterations: 21.1 \%
Number of Iterations: 10 (maximum specified: 10)

N1 Arrival Flow value is reduced due to capacity constraint at oversaturated upstream lanes.

| Movement Performance - Pedestrians |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { Mov } \\ & \hline \text { ID } \end{aligned}$ | Description | Demand Flow ped/h | Average Delay sec | Level of Service | Average Back Pedestrian ped | of Queue Distance $\qquad$ | Prop. Queued | Effective Stop Rate per ped |
| 2P | South Full Crossing | 4 | 18.6 | LOS B | 0.0 | 0.0 | 0.61 | 0.61 |
| 8P | East Full Crossing | 7 | 12.5 | LOS B | 0.0 | 0.0 | 0.50 | 0.50 |
| 6P | North Full Crossing | 3 | 20.5 | LOS C | 0.0 | 0.0 | 0.64 | 0.64 |
| 4 P | West Full Crossing | 9 | 14.1 | LOS B | 0.0 | 0.0 | 0.53 | 0.53 |
| All Pedestrians |  | 23 | 15.4 | LOS B |  |  | 0.55 | 0.55 |

Level of Service (LOS) Method: SIDRA Pedestrian LOS Method (Based on Average Delay)
Pedestrian movement LOS values are based on average delay per pedestrian movement. Intersection LOS value for Pedestrians is based on average delay for all pedestrian movements.

| Approach | 370 | 2.0 |  | 0.898 |  | 47.6 | LOS E | 9.1 | 231.8 |  |  |  |  |
| West: W Main St |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Lane 1 | 40 | 2.0 | 523 | 0.076 | 100 | 6.5 | LOS A | 0.2 | 6.1 | Full | 1600 | 0.0 | 0.0 |
| Lane 2 | 245 | 2.0 | 720 | 0.340 | 100 | 8.5 | LOS A | 1.3 | 32.8 | Short | 180 | 0.0 | NA |
| Approach | 285 | 2.0 |  | 0.340 |  | 8.2 | LOS A | 1.3 | 32.8 |  |  |  |  |
| Intersection | 1465 | 2.0 |  | 1.075 |  | 51.2 | LOS F | 15.2 | 384.9 |  |  |  |  |

Site Level of Service (LOS) Method: Delay \& v/c (HCM 2010). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.
LOS F will result if $\mathrm{v} / \mathrm{c}>1$ irrespective of lane delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 2010).
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: Traditional M1.
HV (\%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
8 Probability of Blockage has been set on the basis of a queue that overflows from a short lane.

| Intersection | 705 | 2.0 |  | 0.275 |  | 3.8 | NA | 1.2 | 31.3 |  |  |  |  |

Site Level of Service (LOS) Method: Delay \& v/c (HCM 2010). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.
LOS $F$ will result if $\mathrm{v} / \mathrm{c}>1$ irrespective of lane delay value (does not apply for approaches and intersection).
Minor Road Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 2010).
NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road lanes.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (\%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

## Preliminary Signal Warrants

${ }^{1}$ Capacity obtained from unsignalized intersection analysis
For guidance on preliminary signal warrant analysis, refer to the Analysis Procedures Manual.
Last Updated: February 2009

${ }^{1}$ Meeting preliminary signal warrants does not guarantee that a signal will be installed. When preliminary signal warrants are met, project analysts need to coordinate with Region Traffic to initiate the traffic signal engineering investigation as outlined in the Traffic Manual. Before a signal can be installed, the engineering investigation must be conducted or reviewed by the Region Traffic Manager who will forward signal recommendations to headquarters. Traffic signal warrants must be met and the State Traffic Engineer's approval obtained before a traffic signal can be installed on a state highway.
